回文序列: 1745. 分割回文串 IV

## 解题思路:

- 1.预处理先用动态规划把字符串处理判断子串是否回文
  - 2.两层循环,区分三个区间,满足三个区间同时为回文区间返回true

## 代码:

```
1 class Solution {
public:
       bool checkPartitioning(string s) {
           int n = s.size();
4
           vector<vector<int>> dp(n,vector<int>(n));
           for(int i = n-1; i >= 0; i--)
           {
                for(int j = i; j < n; j++)
8
                {
                    if(s[i] == s[j])
10
                    {
11
                         if(i == j || i+1 == j)
12
13
                             dp[i][j] = 1;
14
15
                         else
16
17
                             dp[i][j] = dp[i+1][j-1];
18
19
                    }
20
                }
21
22
           for(int i = 1; i < n; i++)
            {
24
                for(int j = i; j < n-1; j++)
25
                {
26
                    if(dp[0][i-1] && dp[i][j] && dp[j+1][n-1])
27
28
                         return true;
                    }
                }
31
32
           return false;
33
34
36 };
```

回文序列: 132. 分割回文串 ||

## 代码:

```
1 class Solution {
public:
       int minCut(string s) {
           int n = s.size();
           vector<vector<int>> IsPal(n, vector<int>(n));
5
           for (int i = n - 1; i >= 0; i --) {
7
               for (int j = i; j < n; j++) {
                   if (s[i] == s[j])
                        IsPal[i][j] = i + 1 < j ? IsPal[i + 1][j - 1] : 1;
10
               }
11
           }
12
           vector<int> dp(n, 0x3f3f3f3f);
13
           for (int i = 0; i < n; i++) {
14
               if (IsPal[0][i])
15
                   dp[i] = 0;
16
               else {
17
                   for (int j = 1; j <= i; j++) {
18
                        if(IsPal[j][i])
19
                        {
20
                            dp[i]= min(dp[j-1]+ 1,dp[i]);
                        }
22
                   }
23
               }
24
25
           }
           return dp[n-1];
26
      }
28 };
```
